

Two New Models
for 2007

Are you having trouble selling combines that are not equipped with Contour Master? Do you have customers that would like to upgrade their non-Contour Master combines?

Hillco Lateral Tilt Systems are the solution for upgrading non-Contour Master John Deere combines to fully automated lateral header tilt control.

Available in three models to fit 9000, Ten, Fifty, and Sixty Series John Deere combines.

LT-100

Fits all 9000, Ten, & Fifty Series Combines

The LT-100 is Hillco's original lateral header tilt system with over five seasons and more than 350 units in the field. Provides 4° of left/right tilt and fully integrates with Contour Master electronics to deliver fully automated lateral header tilt control for the ultimate in ground contouring performance.

LT-200

Fits all 9000, Ten, & Fifty Series Combines

The LT-200 provides the same high performance features of the LT-100 but also includes 9° of fore-aft tilt adjustment. The LT-200 is ideal for those harvesting applications where header to ground fore-aft cutting angle is critical such as harvesting with flex headers. The fore-aft adjustment also eliminates the need for header wedge kits and enhances combine/header compatibility across various models and model years.

New!

LT-600

Fits all Sixty Series STS Combines

Hillco purchases original Contour Master components from John Deere and assembles and packages them into an easy to order and install kit. Supplied with detailed installation instructions, you can purchase an LT-600 for much less than you can purchase the individual parts through your parts department. The only non-stock component is the specially designed lateral tilt hydraulic valve that features speed control and header cushioning.
